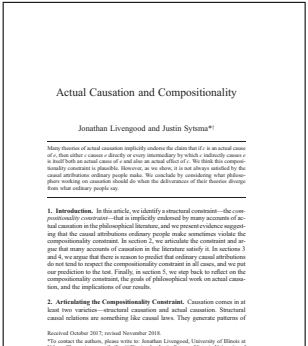
# A Tale of Three Papers



Actual Causation and Compositionality

Jonathan Livengood and Justin Sytsma*†

Many theories of actual causation implicitly endorse the claim that if $c$ is an actual cause of $e$, then either $c$ causes $e$ directly or every intermediary by which $c$ indirectly causes $e$ is itself both an actual cause of $e$ and also an actual effect of $c$. We think this compositionality constraint is plausible. However, as we show, it is not always satisfied by the causal attributions ordinary people make. We conclude by considering what philosophers working on causation should do when the deliverances of their theories diverge from what ordinary people say.

**1. Introduction.** In this article, we identify a structural constraint—the *compositionality constraint*—that is implicitly endorsed by many accounts of actual causation in the philosophical literature, and we present evidence suggesting that the causal attributions ordinary people make sometimes violate the compositionality constraint. In section 2, we articulate the constraint and argue that many accounts of causation in the literature satisfy it. In sections 3 and 4, we argue that there is reason to predict that ordinary causal attributions do not tend to respect the compositionality constraint in all cases, and we put our prediction to the test. Finally, in section 5, we step back to reflect on the compositionality constraint, the goals of philosophical work on actual causation, and the implications of our results.

**2. Articulating the Compositionality Constraint.** Causation comes in at least two varieties—structural causation and actual causation. Structural causal relations are something like causal laws. They generate patterns of

**Abstract**

Jonathan Livengood and Justin Sytsma have published a series of studies on "Actual Causation and Compositionality," in which they investigate causal attributions of laypeople. We use one of their vignettes to follow up on their research. Our findings cast doubt on their conclusion that ordinary causal attributions tend to violate the compositionality constraint if one looks at cases in which someone is responsible for an effect by way of an intermediary that does not share in the responsibility.

### 1. Introduction

Jonathan Livengood and Justin Sytsma have published a series of studies in "Actual Causation and Compositionality." Theories of actual causation, they argue, often at least implicitly endorse a so-called *compositionality constraint*: Imagine that someone, let's name him Alrik, set up a row of domino tiles. He gave the first tile a flick, and as the result of a chain reaction, all the other tiles were knocked over, too. The first tile's falling over was directly caused by Alrik's flick. Since subsequently all the other tiles tumbled over, too, Alrik's flick did also cause the last tile in the chain to fall. It was not directly but *indirectly* caused by Alrik's flick. Here, the flick caused some intermediary tiles to fall, which in turn caused the last tile to fall. This can be expressed in a more abstract way: If we look at some individual events, henceforth denoted as $c$, $d$, and $e$, the compositionality constraint states that, if the event $c$ caused the event $e$, then it did so either directly, or it did so indirectly via one or more intermediaries $d$. In this case, every intermediary $d$ is itself an effect of $c$ and a cause of $e$ (Livengood and Sytsma 2020, 44).

This compositionality constraint intuitively seems to be a reasonable desideratum for any adequate theory of actual causation. However, whether it is indeed correct, Livengood and Sytsma argue, is a different kettle of fish. Arguably, it is not enough to solely rely on the intuitions of a single philosopher or of a small, relatively

**Corresponding author:** Alexander Max Bauer; Email: alexander.max.bauer@uni-oldenburg.de

(Received 13 July 2021; revised 06 May 2022; accepted 10 December 2022; first published online 17 February 2023)

**Abstract**

Livengood and Sytsma (2020) challenge the *compositionality constraint of actual causation* (CCAC), according to which each intermediary of a causal chain is an effect of its predecessor and a cause of its successor link. In several studies, they find support for their hypothesis that the CCAC is not in accordance with the ordinary causal attributions of laypeople. We argue that there are three interrelated problems in their studies' design that we call the *causality-responsibility confusion* (CRC), the *intermediary-ontology confusion* (IOC), and the *cause-end questioning* (CEQ). Avoiding the CRC, the IOC, and the CEQ leads to strong empirical support for the CCAC.

### 1 Introduction

Livengood and Sytsma (2020) (hereafter L&S 2020) challenge the *compositionality constraint of actual causation* (CCAC) that is implicitly entailed by many philosophical accounts of actual causation (e.g., Reichenbach 1956; Salmon 1994; Dowe 1995; Ehring 1997; Lewis 1973, 1986; for a brief summary, see L&S 2020, 43–47). They illustrate the CCAC by a chain of dominoes. There are two ways a person could cause the last domino in a chain to fall: First, they could cause it directly by flicking the last domino of the chain. Second, they could cause it indirectly by flicking, for example, the first domino of the chain. It then falls against the second domino, which falls against the third domino, and so on, until the last domino of the chain finally falls, too. According to the CCAC, the person causes the last domino to fall in both cases. However, if they do it indirectly, then there must be a number of *intermediaries*—the falling of one domino against the next one—such that

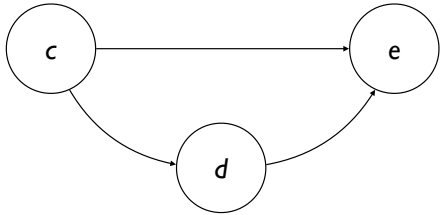
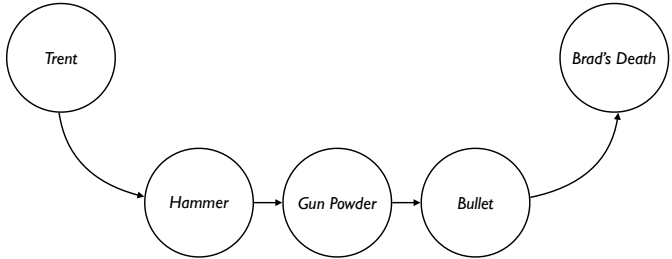
# Livengood and Sytsma (2020): "Actual Causation and Compositionality"

**Compositionality Constraint of Actual Causation:** If *c* is an actual cause of *e*, then either *c* causes *e* directly, or every intermediary *d* by which *c* indirectly causes *e* is itself an actual effect of *c* and an actual cause of *e*. (Livengood and Sytsma 2020, p. 44)



# Livengood and Sytsma (2020): "Actual Causation and Compositionality"

**Revolver Case:** Trent has decided to kill his father, Brad. He aims his loaded revolver at Brad and pulls the trigger, releasing the hammer. The hammer strikes the cartridge, igniting the gun powder. The gun powder explodes, driving the bullet from the gun. The bullet hits Brad in the head. He dies instantly. (Livengood and Sytsma 2020, p. 59)



# Livengood and Sytsma (2020): "Actual Causation and Compositionality"

**Revolver Case**

- $N = 51$
- (dis)agreement on 7-point scale
- 4 statements
  - (A) "Trent caused Brad's death."
  - (B) "The hammer caused Brad's death."
  - (C) "The gun powder caused Brad's death."
  - (D) "The bullet caused Brad's death."

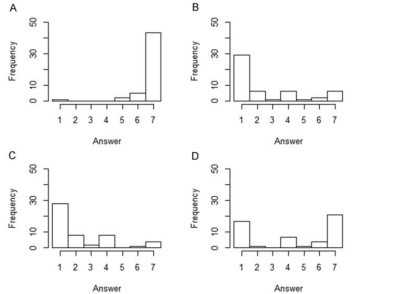


Figure 8. Histograms for study 8. *A*, Trent caused; *B*, hammer caused; *C*, powder caused; *D*, bullet caused.

# Bauer and Romann (2022): "Answers at Gunpoint"

**Events**

8 different events

(A) "pulling the trigger"

(B) "releasing the hammer"

(C) "striking the cartridge"

(D) "igniting the gun powder"

(E) "the gun powder exploding"

(F) "driving the bullet from the gun"

(G) "the bullet hitting Brad in the head"

(H) "the death of Brad"

# Bauer and Romann (2022): "Answers at Gunpoint"

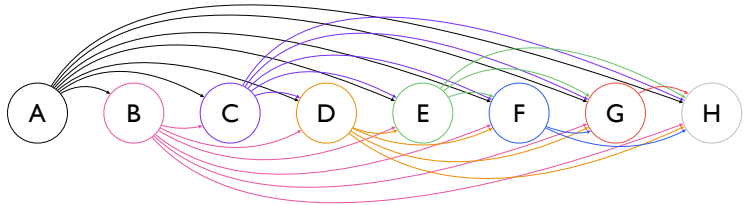
**Combinations of events**

28 "X caused Y" statements, e. g.,

(A/B) "Pulling the trigger caused the release of the hammer."

(C/D) "Striking the cartridge caused the ignition of the gun powder."

(F/G) "The bullet being driven from the gun caused the bullet to hit Brad in the head."



# Bauer and Romann (2022): "Answers at Gunpoint"

**(More or Less) Analogous Statements**

(1) "Trent caused Brad's death."

(A/H) "Pulling the trigger caused the death of Brad."

(2) "The hammer caused Brad's death."

(B/H) "Releasing the hammer caused the death of Brad."

(3) "The gun powder caused Brad's death."

(D/H) "Igniting the gun powder caused the death of Brad."

(E/H) "The explosion of the gun powder caused the death of Brad."

(4) "The bullet powder caused Brad's death."

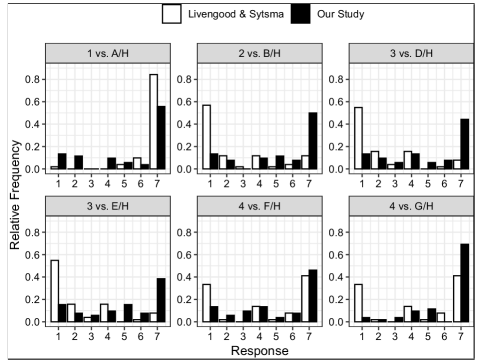
(F/H) "The bullet being driven from the gun caused the death of Brad."

(G/H) "The bullet hitting Brad in the head caused the death of Brad."

# Bauer and Romann (2022): "Answers at Gunpoint"

**Results**

- $N = 52$
- (dis)agreement on 7-point scale
- 28 statements
- central tendency for no statement smaller than the "neutral" value 4



# Bauer and Kornmesser (2023): "Poisoned Babies, Shot Fathers, and Ruined Experiments"

**Causation–Responsibility Confusion:** In "x caused y" statements, the verb "cause" is ambiguous and might be understood in moral terms (also see Samland and Waldmann 2014)

**Intermediary–Ontology Confusion:** Typically, events are the relata of causal chains, not agents or objects. Using agents or objects leads people to understand the verb "cause" in moral terms. (also see Samland and Waldmann 2016)

**Cause-End Questioning:** If, in "x caused y" statements, y is always the end point of a causal chain, this emphasises the end point. If the end point is of moral significane, this might lead subjects to view the statements in moral terms (also see Bauer and Romann 2022)

# Bauer and Kornmesser (2023): "Poisoned Babies, Shot Fathers, and Ruined Experiments"

**Design**

- $N \approx 60$ for each study (16 studies in total)
- (dis)agreement on 7-point scale
- vignettes from Livengood and Sytsma (2020)
  - poisoned cup vignette
  - revolver vignette
  - GFCI vignette
- studies for each vignette
  - replication
  - exclusion of IOC
  - exclusion of CRC
  - exclusion of CEQ
  - simultaneous exclusion of IOC, CRC, and CEQ

# Bauer and Kornmesser (2023): "Poisoned Babies, Shot Fathers, and Ruined Experiments"

**Results**

- successful replication (for all vignettes)
- excluding IOC led to less disagreement that intermediaries are causes (for poisoned cup and revolver vignette)
- excluding CRC led to agreement that intermediaries are causes (for poisoned cup and revolver vignette)
- excluding CEQ led to agreement that intermediaries are causes (for all vignettes)
- simultaneous exclusion of IOC, CRC, and CEQ led to agreement that intermediaries are causes (for all vignettes)

# Takeaway Points

**Key Assumptions in Light of the Data**

- if asked the right way, subjects can be prevented from confusing causation with responsibility
- subjects' intuitions are not in conflict with the Compositionality Constraint of Actual Causation (contrary to Livengood and Sytsma 2020)
- responsibility might not be part of the concept of causation (contrary to proponents of the *responsibility view*)

**Poisoned Cup Vignette:** Amy wants to kill her daughter, Jessica, but she doesn't want to go to prison for murder. As such, Amy hatches a plan. She arranges for a babysitter, Courtney, to take care of Jessica while she is out of town on business. Before leaving, Amy laces one of Jessica's sippy cups with a deadly poison that is very difficult to detect. That evening, Courtney gives Jessica juice in the poisoned sippy cup. Jessica drinks the juice and dies two hours later. (Livengood and Sytsma 2020, p. 49)

**GFCI Vignette:** John is a scientist conducting a very important experiment on an unusual species of plant. His experiment requires growing his plants under a special light, which is plugged into an outlet with a ground fault circuit interrupter (GFCI) safety mechanism. The pipes running to John's laboratory were correctly manufactured and installed, and the system was protected from any changes in weather condition.

Despite there being nothing wrong with the pipes, one day a pipe burst in John's laboratory. Water ran into the outlet powering the special light. A properly functioning GFCI safety mechanism will break the circuit so that no power flows through its outlet if exposed to water in this way. And in fact, the GFCI safety mechanism did break the circuit. The special light turned off and the experiment was ruined. (Livengood and Sytsma 2020, p. 62)
